

Climate Change

Climate change, need we fear it? Climate change is exactly what it sounds like. It is where the climate changes. This type of event is no new thing, it has been happening for millions maybe billions of years. I think that though climate change is an important thing that is going on. I think that people are overreacting by taking action physically against private corporations, such as handcuffing themselves to equipment and stopping people from getting in. They have a right to speak their mind but they sometimes do it in the wrong way. Not saying that all people do this, but some people do. I also think that the reason that some people are saying it is a huge problem is because they are exploiting it for their own benefit. Some of the issues that do arise from climate change are the extreme weather, the involvement of the government, and the rising levels of water throughout the world.

One of the problems that has been taken up into consent from the climate change is the rising water levels. In the past couple hundred years that man has been using tons of coal there has been a dramatic rise in the amount of carbon dioxide in the atmosphere and has been supposedly linked to the melting of polar ice and the rise of sea levels. The water has risen lately but only like a foot. It may not sound like a lot but one foot can create big problems like more extreme weather. Some theorists think that by 2100 it will rise about 5 feet. Due to all of those issues it has gotten the attention of many politicians.

Since there has been some controversy from the rising sea levels it has caught the attention of people in the government. People fear for their future generations and there is not an issue with it but when they take action to fix it many activists take the wrong course of action. The government will see that the climate change is an issue to address to get into office. The way that some people use this is by going and proposing new laws that would infringe on the business, and automotive rights, actually any fossil fuel consumers rights to use that source of energy. When the government gets involved they will make radical changes to everyday life. For example the carbon cars. This cards limits your usage of carbon emitting fuels. When these are made it will affect the coal, gas, and oil companies. The way it will change it is because it will reduce profits. When profits drop the price of fossil fuels will rise. When the costs rise they will sell even less and it will cycle back and get more expensive and put them out of business. Evidence of this happening in the real world is in Europe. What that might do is reduce the carbon fuel consumption and reduce the parts per million of carbon in the atmosphere. On another topic the extreme weather will get more severe if the sea levels

will continue to rise.

Some people think that the extreme weather is a direct result of the human carbon emissions. I for one think that mankind is not the only factor. The weather throughout the world has been getting worse and worse. For example the weather in some places of the world has gotten extreme, the dry has become drier, the wetter has gotten wetter. Some opposing arguments have brought up some good points such as the natural rising and lowering of temperature of the world have been going up and down for billions of years. Not to say that that isn't true. The climate has been doing this and will keep doing this but the transition from average and abnormal has brought up some very important supporting evidence of climate change in the world.

I think that climate change is a very important issue but people are exploiting it and blowing it completely out of proportion. So to wrap up, climate change is a rising issue that should be dealt with but within boundaries. So need we fear the change in climate, the answer is no but you should be cautious. You can believe whatever you want to believe and nobody can change that.
